ICR-B150

RRP £239.00

- Features as the ICR-B130 with the added advantage of being compatible with most leading voice recognition packages, enabling voice files to be converted straight to text.
- Complete with 32 MB card for over 4 hours recording.

Sanyo have produced the most exciting range of digital dictation machines yet. The ICR-B130 and ICR-B150 are designed to record dictation, meetings and conferences with exceptional high quality. Both models combine the familiar and easy operation of a traditional tape based dictation machine with the advanced features and versatility of a digital device. Storing up to 17 hours of quality recording, the voice files can be downloaded to a PC and e-mailed for storage, editing and transcription, using the on-screen PC software.

ERGONOMIC DESIGN

Finished in metallic silver, the lightweight design is shaped to fit comfortably in to the palm of your hand for hours of continuous dictation. The four position slide control allows single handed operation, moving straight from record to review and then into play in one smooth motion. A user friendly menu toggle is positioned at the front of the recorder, controlling all the advanced digital functions including voice activation, recording mode, folder selection, User ID, time/date and alarm setting.

SUPERIOR SOUND QUALITY

Combining good looks with high quality recording, the machines feature three tiny but powerful microphones, maximising pick up while reducing background distortion. Playback on the unit is via an internal speaker which produces crisp, clean delivery of the recording and once downloaded to the PC, playback can be via your PC sound system.

EXTENSIVE RECORDING CAPACITY

Utilising removable multimedia cards, the ICR-B130 is supplied with a 16mb card (enough for 2 hours recording) and the ICR-B150 with a 32mb card for over 4 hours. There is also an option to slot in a 128mb card for as much as 17 hours recording. Multimedia cards allow you to store recordings indefinitely or re-use them again and again as they are totally wear resistant.

ON-BOARD EDITING

A major advantage of digital voice processing is the ability to create finished, edited voice memos. The complete on-board editing function, enables the author to make changes to the existing recording by inserting or deleting words sentences or even whole paragraphs in an instant. A new thought or idea can quite easily be inserted into the existing voice memo or alternatively be recorded as a new file.

MANAGEMENT SYSTEM

Both recorders include three folders for voice file management, capable of storing up to 99 messages per folder. Each recording is automatically stored with a time and date stamp and when the unit is being shared between authors, a User ID can be assigned. An alarm function with two pre-recorded voice messages is also available to remind you of those important appointments.

PC CONNECTION

Voice files can be downloaded directly onto the PC using the USB cable supplied. Once the voice files are stored on the PC, they can be efficiently transferred via a network or by email to an audio typist for traditional transcription, possibly even the other side of the world. The professional transcription software provides the audio typist with a sophisticated approach to retrieving, archiving and transcribing digital dictation on the PC.

TRANSCRIPTION

Traditional transcription features such as playback, rewind, fast forward, speed control and adjustable backspace are combined with many advanced digital features allowing the system to be adjusted to suit both personal preferences and workflow. Transcription kit available - includes foot pedal, headset and transcription software. **RRP £149.00**
